Job market paper	Cash transfers and fertility: from short to long run (with Lidia Cruces) Many developed countries face a demographic scenario of population decline driven by low fertility rates. As a response, governments are deploying family policies to increase the number of children. In this paper we propose a dynamic life-cycle model of fertility and female labour force participation, and use the cleanly identified short-term effects on the aggregate number of births of a cash transfer policy from Spain to calibrate its parameters. We use the model to quantify the long-term effects on fertility, and find that they are about half as large as the short-term ones. Moreover, we find that an alternative policy consisting of childcare subsidisation yields only slightly smaller effects on fertility, but positive labour force participation effects on mothers. Finally, we explore how the coexistence of temporal and permanent contracts in Spain, which have different earnings profiles, affects fertility and interacts with cash transfers. The effects on fertility of this type of labour market are large, mainly driven by increased returns to experience during crucial child-bearing years.	

However, the effects of the cash transfers do not change in a scenario with a unique type of contract.

Working papers	The Sex Ratio, Marriage, and Bargaining: A Look at China <i>Revision Requested, Review of Economic Dynamics</i> <ul style="list-style-type: none"> Nominated for best early-career paper at the 1st International Workshop on the Chinese Development Model (Barcelona, Spain, July 2022).
